One path for every person: nothing is issued until two people approve

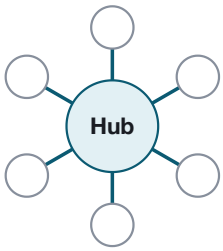

Machines are enrolled by a vetted custodian, each with its own certificate and access.

Two approvals stand between an invitation and a credential.

Pair-by-pair links grow much faster than the systems

Pair by pair
6 systems, 15 links

Through one shared hub
6 systems, 6 connections

Pair by pair, 20 systems need 190 links and 50 need 1,225. Through one hub: 20 and 50.

The gap widens with every system added: at 20 systems it is 190 links against 20 connections.
